Living With a Star: Science that Matters to People

Madhulika (Lika) Guhathakurta
LWS Lead Program Scientist, Heliophysics
NASA Headquarters (On detail at NASA Ames)
Why Do Science?

Understanding the Sun and its interactions with the Earth and the Solar System.

Solve fundamental mysteries of Heliophysics
Understand the nature of our home in space
Build the knowledge to forecast space weather throughout the heliosphere

Understanding the Sun and its interactions with the Earth and the Solar System.

What is Heliophysics

Heliophysics is an environmental science:
   a unique hybrid between meteorology and astrophysics

It has an applied branch
   space weather

And a pure branch
   fundamental physical process

- Magnetic reconnection
- Propagation models of solar disturbances out to 2 AU

In the US National Space Weather Program 1995
Living With a Star 2000, ILWS 2003
International Heliosophysical Year 2007

Applications directed science coordinated by NASA & international community
Add comparative heliospheric studies
Heliophysical: A broadening of the concept "geophysical," extending the connections from the Earth to the Sun & interplanetary space.
Heliophysics as a Scientific Discipline

NASA’s Earliest scientific successes Explorer 1 in 1958 (Radiation Belts) and Mariner 3 in 1963 (Solar Wind), and SkyLab (1973) discovered previously undetected processes and conditions, that directly modulate the Earth. These efforts set the stage for the discovery of the connected system of systems in the solar system that comprise the focus of heliophysics research (past).

The system of systems is driven by the interaction of three forces, pressure, gravity and magnetism; for which the universal physical processes governing order and disorder have not yet been fully uncovered.

The results of research to date have yielded not only new cultural and intellectual knowledge, but have provided benefits with utility, both, political and economic, to the nation and the world.
Examples of Discipline-Specific General Laws or Principles

ASTRONOMY
Kepler’s Laws, Hertzsprung-Russell diagram, expanding universe

CHEMISTRY
periodic table, valence, Le Chatelier’s Principle

BIOLOGY
evolution, double helix

GEOLOGY
deep time, plate tectonics

METEOROLOGY
Hadley cell, baroclinic instability

HELIOPHYSICS
solar (stellar) wind
magnetospheric convection
magnetic organization of matter
explosive energy conversion (CMEs & substorms)
magnetically (non-locally) coupled systems

The project of uncovering universal processes of heliophysics corresponds to the ‘Copenhagen’ project of quantum mechanics

• Interdisciplinary communities and tools
Ubiquitous Small-Scale Magnetic Fields on the Sun: Origin and Space Weather Effects

Irina Kitiashvili and Nagi Mansour (NASA/Ames)

“Magnetic carpet” on the Sun, simulated with the parallel 3D radiative magnetohydrodynamic code “StellarBox” using NASA’s Pleiades supercomputer. The “carpet” consists of small-scale magnetic fields generated by turbulent dynamo action just beneath the solar surface.

The simulations clearly demonstrate that:

• Small-scale dynamos are turbulent in nature.

• Local dynamos have their strongest efficiency in the subsurface layers of the convective zone.

• Different properties of seed magnetic fields have little effect on the properties of the generated magnetic fields.

• Small-scale dynamo action causes magnetic field amplification from extremely weak values ($10^{-2}$ – $10^{-6}$ Gauss) to more than 1000 Gauss.

The results are used for interpretation of data from NASA’s Solar Dynamics Observatory, Hinode, and IRIS missions.

Image from a simulation of magnetic structures formed by a turbulent dynamo on the Sun, generated from an initial $10^{-6}$ Gauss random seed field. The blue-red color scale corresponds to magnetic field strength from -300 to 300 Gauss. A typical size of the magnetic structures is 100 to 300 kilometers.
This is a complex system with many different temporal and spatial scales. The system is multi-scale & couples between scales.

Processes operating at one scale can influence phenomena at other scales.

**HPD is Organized into Four Major Sections**

Goal: Understand the Sun and its interactions with Earth and the solar system including space weather

**Living With a Star**

*Solve the fundamental physics mysteries of heliophysics:* Explore and examine the physical processes in the space environment from the sun to the Earth and throughout the solar system.

*Build the knowledge to forecast space weather throughout the heliosphere:* Develop the knowledge and capability to detect and predict extreme conditions in space to protect life and society and to safeguard human and robotic explorers beyond Earth.

**Solar Terrestrial Probes**

*Understand the nature of our home in space:* Advance our understanding of the connections that link the sun, the Earth, planetary space environments, and the outer reaches of our solar system

**Explorers**

Smaller flight programs, competed science topics, often PI-led

**Research**

Scientific research projects utilizing existing data plus theory and modeling
The Heliophysics Observatory Fleet

NASA/Goddard Space Flight Center Scientific Visualization Studio

2012 Sep 17 11:55:00 (UTC)
Heliophysics System Observatory

A coordinated and complementary fleet of spacecraft to understand the Sun and its interactions with Earth and the solar system.

Heliophysics has 19 operating missions (on 33 spacecraft): Voyager, Geotail, Wind, SOHO, ACE, Cluster, TIMED, RHESSI, TWINS, Hinode, STERE0, THEMIS/ARTEMIS, AIM, CINDI, IBEX, SDO, Van Allen Probes, IRIS, MMS.

(Missions in red contribute to operational Space Weather.)

5 missions are in various phases of development: SET, SOC, SPP, ICON, and GOLD.

$5.5B total investment in Heliophysics space assets (excluding launch costs)$68M annual operating budget (1.2% per year)
Looking Forward: New HSO Components

Addition of new HSO component where each component need not carry a comprehensive payload
- The network can grow serendipitously, with key measurements made on distributed platforms
- Single instrument MOOs
- Cubesats dedicated to one or two instruments
- Individual measurement sets add value by complementing the existing network

In addition, we need techniques to assess the value of additional components to the HSO as a whole
- Models of data assimilation effectiveness
- What is the minimum infrastructure?
- How can we assess and maintain system reliability
Civilian Spacecraft at Geostationary Orbit

Estimated to be greater than $200 billion in space assets
Global Positioning System used: In-vehicle navigation systems, railway control, highway traffic management, emergency response, commercial aviation, and much more...

GPS Global Production Value—expected growth:
2003 - $13 billion
2008 - $21.5 billion
2017 - $757 billion

Industrial Technology Research Institute (ITRI) – Mar 2005

Space weather can create positioning errors larger than 50 meters
—A mid-latitude problem (where most users reside!)
Flights rely on HF (3 – 30 MHz) communication inside the 82 degree circle.

Federal Aviation Regulation Sec. 121.99 – aircraft must have two-way radio communication over the entire route with dispatch office and air traffic control.

Airlines will often re-route flights away from polar routes during radiation and geomagnetic storms at a cost that can exceed $100,000 per flight.
Satellite Industry

Needs Solar storm warnings and alerts:

- Instruments and/or spacecraft turned off or safed
- Maneuver planning
- Anomaly assessments
- Orbit determination accuracy
- Increased spacecraft and instrument monitoring for health and safety during solar storms
Electrical Power Grid...

The grid is becoming increasingly vulnerable to space weather events. Future Directions in Satellite-derived Weather and Climate Information for the Electric Energy Industry – Workshop Report Jun 2004

“...blackouts could exceed even that of the very large blackout that occurred in August 14, 2003. And there is no part of the U.S. power grid that is immune to this... we could impact over 100 million population in the worst case scenario.” John Kappenman - before U.S. House Subcommittee on Environment, Technology & Standards Subcommittee Hearing on “What is Space Weather and Who Should Forecast It?”

Transformer winding failure

Transformer exit lead overheating
Look out! Solar activity is so low that Solar Max looks a lot like Solar Min.

As the scope of space weather forecasting expands to other planets, it is also expanding in directions traditionally connected to climate research. Climate refers to changes in planetary atmospheres and surfaces that unfold much more slowly than individual storms. There is no question that solar activity is pertinent to climate time scales. The radiative output of the Sun, the size and polarity of the Sun’s magnetic field, the number of sunspots, and the shielding power of the Sun’s magnetosphere against cosmic rays all change over decades, centuries, and millennia.

Small variations in the visible (0.1%), but big changes in the UV. *(UV, EUV and X-ray spectral irradiances are drivers of space weather)*
Space Weather Occurs at all Phases of the Solar Cycle...

**Solar La Niña**
(low sunspot number)

- extreme galactic cosmic rays
- rapid accumulation of space junk
- sharp contraction of the heliosphere
- collapse of the upper atmosphere
- total solar irradiance changes

**Solar El Niño**
(high sunspot number)

- super solar flares
- extreme solar “cosmic rays” (energetic particles)
- radio blackouts
- extreme geomagnetic storms
- melted power grid transformers – power blackouts
- solar wind streams hit Earth

Illustration shows smoothed monthly sunspot counts from the past six solar cycles plotted horizontally instead of vertically. High sunspot numbers are in red and on the right, low sunspot numbers are in blue and on the left. Associated with each high and low sunspot numbers are different space weather impacts experienced at Earth (doi: 10.1002/swe.20039).
An Extreme Event: Carrington 1859

[Diagram showing high-fluence proton events from 1855 to 2001, with a focus on 1859 events and auroral observations.]

[Courtesy J. Green/NRC Study]
Large geomagnetic storms can occur with smaller cycles

The largest geomagnetic storms on record occurred during lower than average cycles

So this solar cycle is even smaller ..... And where is our Carrington Event?
Surrounding the sun has allowed us to detect major storms that otherwise we might have missed.

A Solar Superstorm Narrowly Missed Earth in July 2012

July 23, 2012, one of the fastest CMEs of the Space Age rocketed away from the western limb of the sun travelling at a speed greater than 3000 km/s.

STEREO-A was in the line of fire, and the spacecraft was hit by a severe solar radiation storm. It was stronger than any proton event observed since 1976. Without STEREO-A, this major event would have passed unnoticed.
"If this storm had hit Earth, we would still be picking up the pieces."
--Dan Baker, 2014 Space Weather Workshop

"Had it hit Earth, it probably would have been like the big one in 1859. The effect today [on] our modern technologies would have been tremendous."

**THE MAIN FOCUS OF MODERN SPACE WEATHER FORECASTING HAS BEEN EARTH**
Space Weather Swings Between Extreme Effects

**Solar La Niña** (low sunspot number)
- extreme galactic cosmic rays
- rapid accumulation of space junk
- sharp contraction of the heliosphere
- collapse of the upper atmosphere
- total solar irradiance changes

**Solar El Niño** (high sunspot number)
- super solar flares
- extreme solar “cosmic rays” (energetic particles)
- radio blackouts
- extreme geomagnetic storms
- melted power grid transformers – power blackouts
- solar wind streams hit Earth

Illustration shows smoothed monthly sunspot counts from the past six solar cycles plotted horizontally instead of vertically. High sunspot numbers are in red and on the right, low sunspot numbers are in blue and on the left. Associated with each high and low sunspot numbers are different space weather impacts experienced at Earth (doi: 10.1002/swe.20039).
Who’s Afraid of a Solar Flare?
Cosmic rays are much scarier

When solar activity is low, cosmic rays are able to invade the inner solar system. During the 2008-2009 solar minimum, cosmic rays surged to record-high levels.

![Cosmic Ray Fe Nuclei](image)

Cosmic rays from distant supernova explosions and black holes are far more energetic and penetrating than particles from relatively puny solar flares.
The solar system is protected from galactic cosmic rays by its heliosphere, the bubble surrounding the Earth and the planets that is created by the solar wind/magnetic field.
During periods of low solar activity, cosmic rays pose a threat not only to astronauts, but also to ordinary air travelers.

A 100,000 mile frequent flyer receives a dose equivalent to ~10 chest x-rays.

So what about people in space? Or interplanetary space???
High Energy Particles Hazards to Humans

Humans in space

Integration across Research and Technology Required...
What About Mars?

The #1 movie in theatres right now is The Martian, a film adaptation of Andy Weir's eponymous book. It tells the heart-pounding story of fictional astronaut Mark Watney, who is stranded on Mars.

It's a thrilling adventure told with considerable accuracy—except, perhaps, for one thing.

Andy Weir does a good job of representing the risks faced by Mark Watney stranded on Mars, but he is silent on the threat of radiation, not just to Mark but particularly to the crew of the Hermes as they execute a daring rescue mission that more than doubles their time in deep space," according to Dr. Ron Turner.

Watney is actually safer than the crew of the Hermes. Turner explains: "The radiation exposure is significantly less on the surface of Mars. For one thing, the planet itself reduces exposure by half. The atmosphere, while thin, further reduces the dose. The dose rate on Mars, while high, is only about 1/3rd of that on the Hermes."
We’re entering a new era of Interplanetary Space Weather

This is possible because we’ve got the Sun surrounded.
Interplanetary Space Weather: A New Paradigm
This development is akin to the first satellite images of hurricanes on Earth.

Tropospheric Weather: Storm Tracking is Essential for Mid-Term Forecasting

Weather in the mid-west today is Washington’s weather tomorrow.

Space Weather Analogue: Coronal Mass Ejection (CME) Tracking is Essential for Mid-Term Forecasting
The next frontier in space weather forecasting involves the uninterrupted tracking of storm clouds from the sun to the planets.

STEREO includes 5 telescopes that monitor the sky at large angles from the Sun.

NASA's STEREO spacecraft and new data processing techniques have succeeded in tracking space weather events from their origin in the Sun's ultra hot corona to impact with the Earth's magnetosphere.
Reasons for developing this predictive capability may be divided into three pressing areas:

**Human safety** is of paramount concern. At the moment, humans are confined to low-Earth orbit where the planetary magnetic field and the body of Earth itself provide substantial protection against solar storms. Eventually, though, astronauts will travel to the Moon, Mars and beyond where natural shielding is considerably less.

**Spacecraft operations** are also key. Energetic particles accelerated by solar storms can cause onboard computers to reboot, introduce confusing noise in cameras and other digital sensors, or simply accumulate on the surface of a spacecraft until a discharge causes serious problems.

**Scientific research** could be the greatest beneficiary of interplanetary space weather forecasting. What happens to asteroids, comets, planetary rings and planets themselves when they are hit by solar storms? Finding out often requires looking at precisely the right moment.
Sun-Earth System Science:
Growth from a “consuming” science to a “producing” science for the benefit of humankind

Space Weather is no longer the domain of Earth only!

Space Weather is now also Interplanetary!!

Space Weather just became Exoplanetary!!!

Extreme Space Weather on Close-in Exoplanets

T=00:00
Solar variability
On global/regional climate

Solar-stellar connection, Habitability of exoplanets

Planetary atmospheres and their interactions with solar variability, (climate & weather)

Space Science

2010-2015, 21 appointments

To train the next generation of researchers needed in the emerging field of heliophysics, in honor of the pioneering
National Air and Space Museum Debuts Must-See Sun Video Wall

- Unveiled on March 18th, the 7 by 6 ft. Video Wall streams data from NASA’s Solar Dynamics Observatory, or SDO.

- SDO takes ten images of the differing layers of the Sun's atmosphere every 12 seconds with an image size of 4096 x 4096 pixels. By comparison, a high-definition TV can only display 1920 x 1080 pixels.

- Tremendous computing power is required to visualize the data from SDO. This data is improving our understanding of the Sun's ever-changing magnetism.

- The Video Wall is located at the base of the Skylab exhibit in the Space Race Gallery.
